1. Air-Cooled Refrigeration System
The RDT UL Listed "Air-Cooled" Refrigeration system shall be housed in a compact structural steel frame. The system shall include an air-cooled aluminum fin copper tube condenser designed to operate at 15 degrees TD. Entire frame shall be constructed using powder coated steel. Condenser fan motors shall be mounted to the frame.

Each unit shall be equipped with a ball-bearing fan motor, pre-set head pressure control suction filter, sight glass drier, liquid line inlet and outlet valve, defrost cycle, and high pressure super-hose connections.

Condensing units shall contain scroll, hermetic, semi-hermetic, and/or discus type compressor(s) assembled to operate with the refrigerant specified for both medium and low temperature applications.

2. Evaporator Coils
A. Evaporator coils shall be direct expansion type fabricated of copper tubes with aluminum fins.
B. All evaporator coils shall be provided with solenoid valve, thermostatic or electronic expansion valve and thermostat.

3. Pre-Piping
All refrigerant lines shall be extended to one side of the package in a neat and orderly manner. All tubing shall be securely supported and anchored with non-corrosive coated clamps.

All joints must be brazed, not soldered.

All piping and controls shall be factory pressure-tested with dry nitrogen.

4. Control Panel
The package shall have a factory-mounted and pre-wired control panel complete with main disconnect (non fused) where required, circuit breakers, contactors wired for single point power connection.

General Information
Contractors shall verify all dimensions onsite and coordinate with other trades.

General contractor shall prepare the platform, curbed openings and weatherproofing the unit after installation.

Refrigeration Contractor
All copper tubing to be refrigerant grade, A.C.R. or type "L".

Brazing should be used for all refrigerant piping. Silver solder or soft solder is not acceptable.

All piping to be pressure tested with nitrogen at 300 psi. After the condensing unit and coil have been connected the balance of the system shall be leak tested with the valves open at 200 psi.

The complete system shall be evacuated with a vacuum pump. Each unit should be charged tested and adjusted to assure operation.

Refrigeration contractor should provide and install the drain-line heater in freezer. Heater shall be connected by electrical contractor. Seal all penetrations through the walk-in with foam.

Electrical Contractor
Electrical contractor to provide power for refrigeration package and connect control and defrost system as called for in the wiring diagram.

Electrical contractor to connect drain-line heater in the freezer. Seal all penetrations through the walk-in with foam.

All electrical wiring and installation shall be in accordance with the wiring diagram and local codes.

Plumbing Contractor
Plumbing contractor to provide copper drain lines for walk-in refrigerator and freezer, pitched 1/4" per foot of run. Trap drain line outside of refrigerated space to avoid entrance of warm, moist air. Seal all penetrations through the walk-in with foam.

All plumbing installation shall be in accordance with local codes.

MECHANICAL DETAILS - PIPE

TreanorHL NO. HE0569.2302.01

GREASE EXHAUST NOTES:

A. GREASE DUCT MATERIALS: GREASE DUCTS AND PLENUMS SERVING A TYPE I HOOD SHALL BE CONSTRUCTED OF AT LEAST 0.055-INCH-THICK (NO. 16 MANUFACTURER'S STANDARD GAGE) BLACK STEEL OR STAINLESS AT LEAST 0.044 INCH IN THICKNESS.
B. JOINTS AND SEAMS OF GREASE DUCTS: JOINTS AND SEAMS SHALL BE MADE WITH A CONTINUOUS LIQUID-TIGHT WELD OR BRAZE MADE ON THE EXTERNAL SURFACE OF THE DUCT SYSTEM. A VIBRATION ISOLATION CONNECTOR MAY BE USED, PROVIDED IT CONSISTS OF NON-COMBUSTIBLE PACKING IN A METAL SLEEVE JOINT OF APPROVED DESIGN.
C. GREASE DUCT SUPPORTS: DUCT BRACING AND SUPPORTS SHALL BE OF NON-COMBUSTIBLE MATERIAL SECURELY ATTACHED TO THE STRUCTURE AND DESIGNED TO CARRY GRAVITY AND LATERAL LOADS WITHIN THE STRESS LIMITATIONS OF THE BUILDING CODE. BOLTS, SCREWS, RIVETS AND OTHER MECHANICAL FASTENERS SHALL NOT PENETRATE DUCT WALLS.
D. PREVENTION OF GREASE ACCUMULATION: DUCT SYSTEMS SERVING A TYPE I HOOD SHALL BE SO CONSTRUCTED AND INSTALLED THAT GREASE CANNOT BECOME POCKETED IN ANY PORTION THEREOF, AND THE SYSTEM SHALL SLOPE NOT LESS THAN 1/4 UNIT VERTICAL IN 12 UNITS HORIZONTAL (2% SLOPE) TOWARD THE HOOD OR TOWARD AN APPROVED GREASE RESERVOIR. WHERE HORIZONTAL DUCTS EXCEED 75' IN LENGTH, THE SYSTEM SHALL SLOPE NOT LESS THAN 1 UNIT VERTICAL IN 12 UNITS HORIZONTAL (2% SLOPE) TOWARD THE HOOD OR TOWARD AN APPROVED GREASE RESERVOIR. WHEN A CENTRIFUGAL FAN IS USED IT SHALL BE POSITIONED SO THE DISCHARGE OUTLET IS EITHER VERTICAL OR BOTTOM HORIZONTAL WITH THE AIR SO DIVERTED THAT THERE WILL BE NO IMPINGEMENT ON THE ROOF, OTHER EQUIPMENT OR PARTS OF THE STRUCTURE. A VERTICAL DISCHARGE FAN SHALL BE MANUFACTURED WITH AN APPROVED DRAIN OUTLET AT THE BOTTOM OF THE HOUSING TO PERMIT DRAINAGE OF GREASE TO AN APPROVED COLLECTION DEVICE.
E. CLEANOUTS AND OTHER OPENINGS: GREASE DUCT SYSTEMS SHALL NOT HAVE OPENINGS THEREIN OTHER THAN THOSE REQUIRED FOR PROPER OPERATION AND MAINTENANCE OF THE SYSTEM. ANY PORTION OF SUCH SYSTEM HAVING SECTIONS INACCESSIBLE FROM THE DUCT ENTRY OR DISCHARGE SHALL BE PROVIDED WITH ADEQUATE CLEANOUT OPENINGS. CLEANOUT OPENINGS SHALL BE EQUIPPED WITH TIGHT FITTING DOORS CONSTRUCTED OF STEEL HAVING A THICKNESS NOT LESS THAN THAT REQUIRED FOR THE DUCT. DOORS SHALL BE EQUIPPED WITH A SUBSTANTIAL METHOD OF LATCHING, SUFFICIENT TO HOLD THE DOOR TIGHTLY CLOSED. DOORS SHALL BE SO DESIGNED THAT THEY CAN BE OPENED WITHOUT THE USE OF A TOOL. PROVIDE CLEANOUTS IN ALL KITCHEN EXHAUST DUCTWORK AT EVERY CHANGE OF DIRECTION AND AT EVERY 12' OF HORIZONTAL DUCT. PROVIDE CEILING ACCESS PANELS AT ALL GREASE DUCT CLEANOUTS. REFER TO DETAIL 02, SHEET M0.01.
F. DUCT ENCLOSURE: A GREASE DUCT SERVING TYPE I HOOD WHICH PENETRATES A CEILING, WALL OR FLOOR SHALL BE ENCLOSED IN A DUCT ENCLOSURE FROM THE POINT OF PENETRATION. A DUCT MAY ONLY PENETRATE EXTERIOR WALLS AT LOCATIONS WHERE UNPROTECTED OPENINGS ARE PERMITTED BY THE BUILDING CODE. DUCT ENCLOSURES SHALL BE CONSTRUCTED AS THE BUILDING CODE REQUIRES SHAFT ENCLOSURES TO BE CONSTRUCTED. DUCT ENCLOSURES SHALL BE OF AT LEAST ONE-HOUR FIRE-RESISTIVE CONSTRUCTION IN ALL BUILDINGS. THE DUCT ENCLOSURE SHALL BE SEALED AROUND THE DUCT AT THE POINT OF PENETRATION AND VENTED TO THE EXTERIOR THROUGH WEATHER-PROTECTED OPENINGS. THE ENCLOSURE SHALL BE SEPARATED FROM THE DUCT BY AT LEAST 3 INCHES AND NOT MORE THAN 12 INCHES AND SHALL SERVE A SINGLE GREASE EXHAUST DUCT SYSTEM. IF ALLOWED BY LOCAL CODE AUTHORITIES, TYPE I GREASE DUCTS MAY BE WRAPPED IN 2-HR UL RATED "FIREMASTER" OR APPROVED MANUFACTURERS GREASE DUCT FIRE PROTECTION SYSTEM, INSTALLED PER MANUFACTURER'S INSTRUCTIONS.
G. FIRE-RESISTIVE ACCESS OPENING: WHEN CLEANOUT OPENINGS ARE LOCATED IN DUCTS WITHIN A FIRE-RESISTIVE SHAFT OR ENCLOSURE, ACCESS OPENINGS SHALL BE PROVIDED IN THE SHAFT OR ENCLOSURE AT EACH CLEANOUT POINT. THESE ACCESS OPENINGS SHALL BE EQUIPPED WITH TIGHT-FITTING SLIDING OR HINGED DOORS WHICH ARE EQUAL TO FIRE-RESISTIVE PROTECTION TO THAT OF THE SHAFT OR ENCLOSURE.
H. AIR VELOCITY: GREASE DUCT SYSTEMS SERVING A TYPE I HOOD SHALL BE DESIGNED AND INSTALLED IN A MANNER TO PROVIDE AN AIR VELOCITY WITHIN THE DUCT SYSTEM OF NOT LESS THAN 1500 FEET PER MINUTE AND NOT TO EXCEED 2500 FEET PER MINUTE.
I. EXHAUST OUTLETS: EXHAUST OUTLETS FOR GREASE DUCTS SERVING COMMERCIAL FOOD HEAT-PROCESSING EQUIPMENT SHALL EXTEND THROUGH THE ROOF UNLESS OTHERWISE APPROVED BY THE BUILDING OFFICIAL. SUCH EXTENSION SHALL BE AT LEAST 2 FEET ABOVE THE ROOF SURFACE, AT LEAST 10 FEET FROM PARTS OF THE SAME OR CONTIGUOUS BUILDINGS, ADJACENT PROPERTY LINE OR AIR INTAKE OPENING INTO ANY BUILDING, AND SHALL BE LOCATED AT LEAST 10 FEET ABOVE THE ADJOINING GRADE LEVEL.
J. EXCEPTIONS: EXHAUST OUTLETS FOR GREASE DUCTS SERVING COMMERCIAL FOOD HEAT-PROCESSING EQUIPMENT MAY TERMINATE NOT LESS THAN 5 FEET FROM AN ADJACENT BUILDING, ADJACENT PROPERTY LINE OR AIR INTAKE OPENING INTO A BUILDING, IF THE AIR FROM THE EXHAUST OUTLET IS DISCHARGED AWAY FROM SUCH LOCATIONS.
K. KITCHEN EXHAUST HOODS INCLUDING EXHAUST FANS, MAKE-UP AIR FAN, MOTORS, STARTERS, HEATERS AND CURBS - CONTRACTOR SHALL PROVIDE AND INSTALL MOTOR STARTERS, DRAIN LINES, CONTROLLERS, LIGHT AND CONTROL WIRING, MECHANICAL ROUGH-IN AND CONNECTIONS, DUCTWORK, ELECTRICAL ROUGH-IN AND CONNECTIONS, PLACE IN OPERATION AND BALANCE THE SYSTEM. COORDINATE WORK WITH ALL TRADES INVOLVED.

TreanorHL NO. HE0569.2302.01

Single Zone Air Handling Unit (Preheat/Chilled Water/Hot Water Reheat):

General:
- The unit is to have supply fan, hot water coil, chilled water coil and outside air damper. The Control System Contractor to provide a dedicated stand-alone DDC controller for each unit. Each DDC controller shall be located in a NEMA 1 enclosure near the unit in the corresponding mechanical room. Each DDC controller should have battery back-up sufficient to retain any controls databases or algorithm, and ensure controller uptime on a potential loss of primary power. Each DDC controller serving a AHU should have its own UPS to ensure smooth transitions to and from emergency power and allow for proper execution of programs and control.

Unit Enable/Disabling:
- The EMCS optimum start/stop schedule defines the occupied/unoccupied mode of operation.

Fan Control:
- The supply fan runs continuously in occupied Mode.
- Cooling mode: Supply fan shall operate at 50% of maximum airflow (VFD speed to be determined by TAB) at start up and if cooling set point temperature can not be maintained or acheived then the fan shall operate at 100% maximum airflow.
- Heating mode: Supply fan shall operate at 50% of maximum airflow (VFD speed to be determined by TAB) at start up and if heating set point temperature can not be maintained or acheived then the fan shall operate at 100% maximum airflow.

Temperature Control:
- Warm-up or Cool-down:
  - The EMCS determines the required warm-up or cool-down period based on the optimized start algorithm.
  - Upon enabling the unit, the unit heats and cools as required to maintain the occupied heating and cooling setpoints (initially 70°F heating, 74°F cooling) as sensed by a space temperature sensor.
  - During warm-up, the supply air discharge temperature is 90°F (adjustable). During cool-down, the supply air temperature is 55°F (adjustable).
  - Once the occupied setpoint temperature threshold has been reached, the EMCS switches the unit to the occupied mode.
- Occupied Mode:
  - ReHeating Coil: The heating valve modulates to maintain to maintain occupied mode heating space setpoint temperature. Heat coil disables when ambient outside air temperature is above 65°F (adj.) or if unit is not in dehumidification mode (reheat coil to be enabled if in dehumidification mode.)

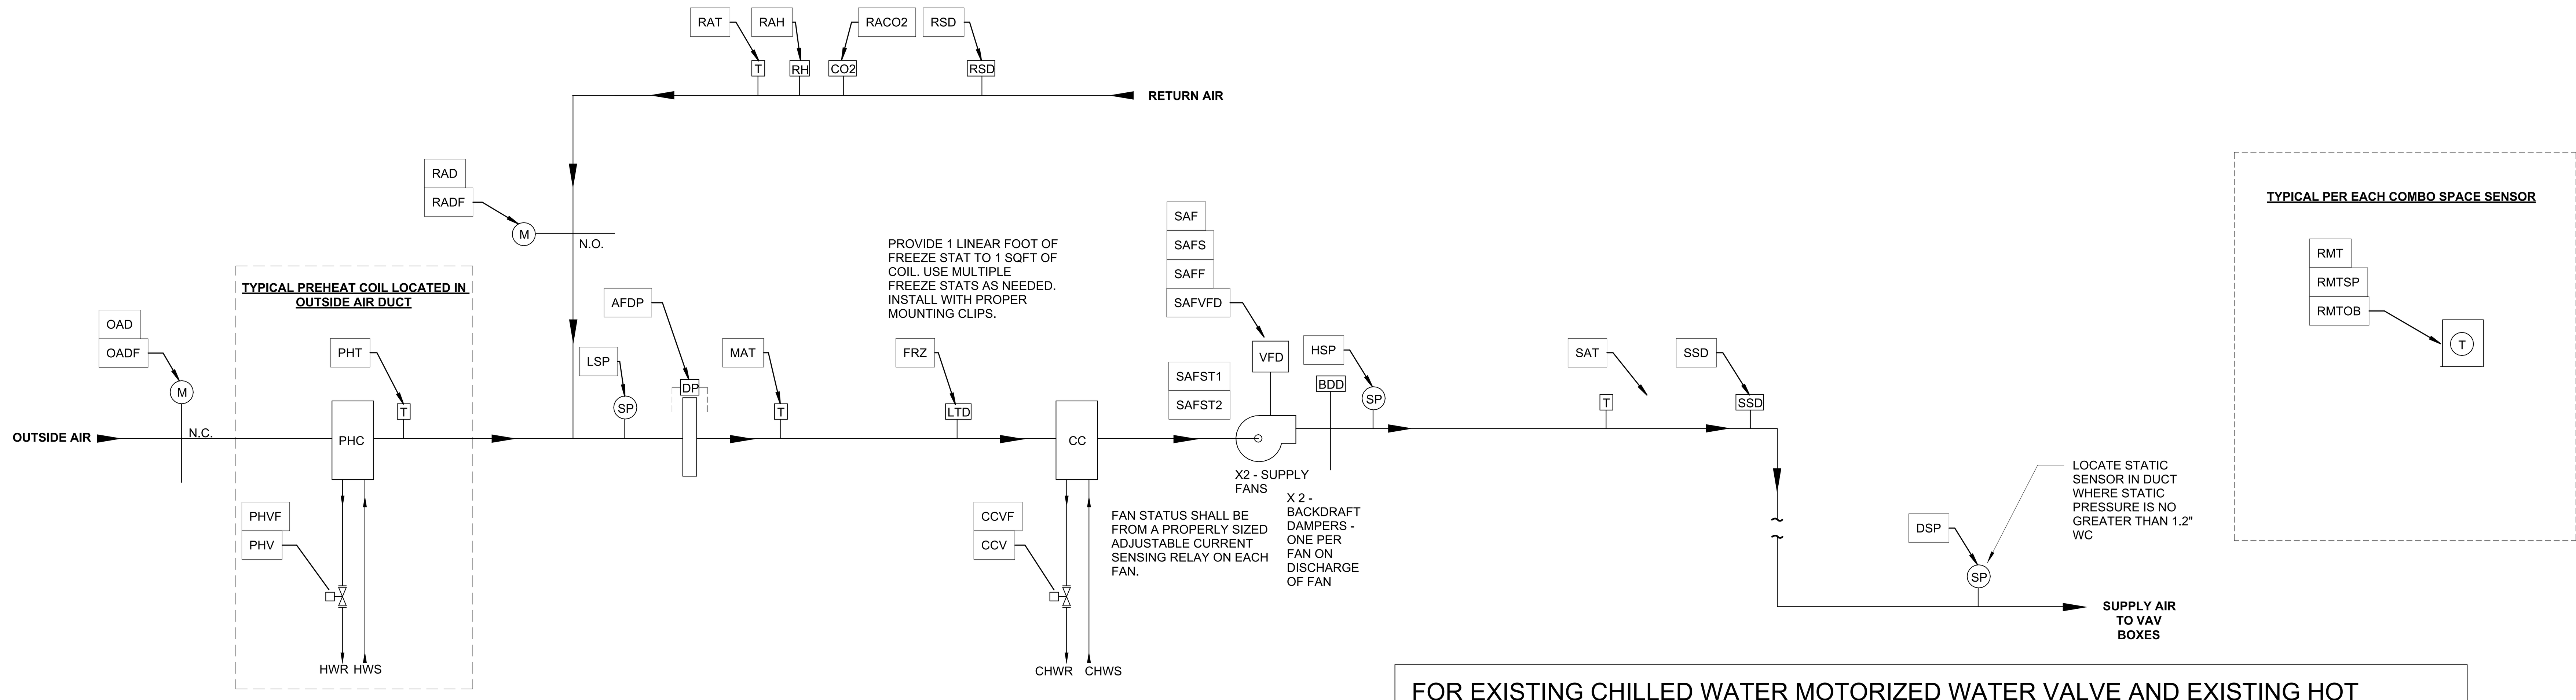
CONTROLS DETAILS - CHW AHU SINGLE-ZONE

TreanorHL NO. HE0569.2302.01



1 MULTI-ZONE CHILLED WATER VAV AHU
NOT TO SCALE

Variable Air Volume Air Handling Unit (Preheat/Chilled Water/ Hot Water Reheat):

General:
- The unit is to have supply fan, hot water coil, chilled water coil and outside air damper. The Control System Contractor to provide a dedicated stand-alone DDC controller for each unit. Each DDC controller shall be located in a NEMA 1 enclosure near the unit in the corresponding mechanical room. Each DDC controller should have battery back-up sufficient to retain any controls databases or algorithm, and ensure controller uptime on a potential loss of primary power. Each DDC controller serving a AHU should have its own UPS to ensure smooth transitions to and from emergency power and allow for proper execution of programs and control.

Unit Enable/Disabling:
- The EMCS optimum start/stop schedule defines the occupied/unoccupied mode of operation.
- During unoccupied times, a minimum number of associated VAV boxes, 40% (adjustable), to request the AHU before AHU operates.

Fan Control:
- The unit operates when the associated VAV boxes it serves are in occupied mode and operational.
- The supply fan VFD is controlled by a static pressure transducer 2/3rds the way down the longest supply duct run. If the static pressure is below setpoint, the supply fan speed increases. If the static pressure is above setpoint, the supply fan speed decreases.
- Provide a static pressure reset algorithm with minimum and maximum limits of 0.5 inches to 1.2 inches (adj.). VAV boxes to be polled for damper position. Static pressure slowly decreases until 25% (adj.) of the VAV box damper positions are at least 90% open.

Temperature Control:
- Warm-up or Cool-down:
  - The EMCS determines the required warm-up or cool-down period based on the optimized start algorithm.
  - Upon enabling the unit, the unit heats and cools as required to maintain the occupied heating and cooling setpoints (initially 70°F heating, 74°F cooling) as sensed by a space temperature sensor.
  - During warm-up, the supply air discharge temperature is 90°F (adj.). During cool-down, the supply air temperature is 55°F (adj.).
  - Once the occupied setpoint temperature threshold has been reached, the EMCS switches the unit to the occupied mode.
- Occupied Mode:
  - Preheat Coil: The preheat valve modulates to maintain preheat discharge air temperature of 40°F (adj.). Preheat coil disables when ambient outside air temperature is above 40°F (adj.).
  - ReHeating Coil: The heating valve modulates tomaintain unit discharge supply air temperature of 55°F (adj.). Heat coil disables when ambient outside air temperature is above 55°F (adj.) or if unit is not in dehumidification mode (reheat coil to be enabled if in dehumidification mode.)
  - Cooling Coil: The chilled water valve modulates to initially maintain unit discharge supply air temperature of 55°F (adj.). Provide a linear supply air temperature reset algorithm between:
    - 55°F (adj.) supply air temperature supply when outside air temperature is at or above 80°F (adj.).
    - 60°F (adj.) supply air temperature supply when outside air temperature is at or below 50°F (adj.).
- Unoccupied Mode:
  - The EMCS enables the unit as required to maintain the unoccupied heating and cooling setpoints (initially 60°F heating and 80°F cooling) as sensed by the VAV box space temperature sensors. A minimum number of associated VAV boxes, 40% (adj.), to request the AHU before AHU operates.

Outside Air Damper Control:
- Warm-up or Cool-down: The outside air damper to be closed.
- Occupied mode:
  - When in the occupied mode AND when GEF-1 is running, the DDC controller shall open the OA damper(s) to the Design MAX Ventilation CFM position (adj.). TAB shall provide the damper position that matches the MAX Design Ventilation CFM required.
  - When in the occupied mode AND when GEF-1 is NOT running, the DDC controller shall back the OA damper(s) down to the Design MIN Ventilation CFM position (adj.). TAB shall provide the damper position that matches the MIN Design Ventilation CFM required. The OA damper shall not be allowed to drop below the minimum position when in occupied moad.
- Unoccupied mode:
  - The outside air damper shall close and the return air damper shall open when the unit is off oe in unoccupied mode.

Dehumidification Mode:
- Dehumidification mode activates when the return air relative humidity is above 60% (adj.) or any associated room relative humiditysensor is above 60% (adj.).
- Dehumidification mode temporarily disables the cooling supply air temperature reset and maintains constant discharge air temperature at 47°F (adj.). Economizer mode is disabled.
- Dehumidification disables when return air relative humidity is 2% (adj.) below humidity setpoint.

Relief Fan Building Pressure Control:
- The relief fan shall run whenever the supply fan has a positive proof of run status on the BMS, and the unit is in economizer mode. The controller shall measure associated building static pressure and modulate the relief fan VFD speed to maintain a building static pressure setpoint of + 0.03 - 0.05 in H2O (adjustable). The relief fan VFD speed shall not drop below 20hz (adj.) when in operation.

Alarms shall be provided as follows:
- Relief Fan Failure: Commanded on, but the status is off.
- Relief Fan in Hand: Commanded off, but the status is on.
- Relief Fan Runtime Exceeded for Maintenance: Status runtime exceeds a user definable limit (adj.).
- Relief Fan VFD Fault.

Safeties:
- Freeze Protection:
  - When the outside air (OA) temperature drops below 36°F (adj.), chilled water and hot water valves open to 20% if not already open. And at least one chilled water pump and one hot water pump shall run.
  - When the OA temperature rises 2°F above freeze protection setpoint for one (1) hour, the reverse occurs.
- Freeze Stat:
  - Provide a temperature low limit switch to disable the unit and close all dampers when it senses that the air temperature is below 36°F (adj.).
- Low Static Shutdown:
  - The unit shall shut down and generate an alarm upon receiving a low static shutdown signal. Low static safety switches shall be initially set at 3”w.c (adj.) and verified by the TAB contractor.
- High Static Shutdown:
  - The unit shall shut down and generate an alarm upon receiving a high static shutdown signal. High static safety switches shall be initially set at 4”w.c (adj.) and verified by the TAB contractor.
- Return Air Smoke Detection:
  - The unit shall shut down and generate an alarm upon receiving a return air smoke detector status.
- Supply Air Smoke Detection:
  - The unit shall shut down and generate an alarm upon receiving a supply air smoke detector status.
- Return and Supply Fan VFD Fault Alarm:
  - The controller shall generate an alarm upon receiving a return or supply air VFD fault alarm. The VFD fault alarm shall be a hardwired input from the VFD to a DDC controller.

Alarms:
- Supply Fans Failure: Commanded on, but the status is off.
- Supply Fans in Hand: Commanded off, but the status is on.
- Supply Fans Runtime Exceeded for Maintenance: Status runtime exceeds a user definable limit (adj.).

210.71 Meeting Rooms (2017 NEC) and 210.65 Meeting Rooms (2020 NEC)

(A) General. Each meeting room of not more than 93 m2 (1000 ft2) in other than dwelling units shall have outlets for nonlocking-type, 125-volt, 15- or 20-ampere receptacles. The outlets shall be installed in accordance with 210.65(B) [210.71 for 2017 NEC]. Where a room or space is provided with movable partition(s), each room size shall be determined with the partition in the position that results in the smallest size meeting room.

Informational Note No. 1: For the purposes of this section, meeting rooms are typically designed or intended for the gathering of seated occupants for such purposes as conferences, deliberations, or similar purposes, where portable electronic equipment such as computers, projectors, or similar equipment is likely to be used.
Informational Note No. 2: Examples of rooms that are not meeting rooms include auditoriums, schoolrooms, and coffee shops.

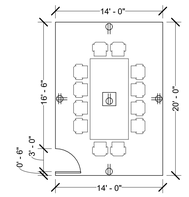
(B) Receptacle Outlets Required. The total number of receptacle outlets, including floor outlets and receptacle outlets in fixed furniture, shall not be less than as determined in (1) and (2).

(1) Receptacle Outlets in Fixed Walls. The required number of receptacle outlets shall be determined in accordance with 210.52(A) (1) through (A)(4). These receptacle outlets shall be permitted to be located as determined by the designer or building owner.
210.52(A)(1) Spacing. Receptacles shall be installed such that no point measured horizontally along the floor line of any wall space is more than 1.8 m (6 ft) from a receptacle outlet.
210.52(A)(2) Wall Space. As used in this section, a wall space shall include the following:
(1) Any space 600 mm (2 ft) or more in width (including space measured around corners) and unbroken along the floor line by doorways and similar openings, fireplaces, and fixed cabinets that do not have countertops or similar work surfaces
(2) The space occupied by fixed panels in walls, excluding sliding panels
(3) The space afforded by fixed room dividers, such as freestanding bar-type counters or railings
210.52(A)(3) Floor Receptacles. Receptacle outlets in or on floors shall not be counted as part of the required number of receptacle outlets unless located within 450 mm (18 in.) of the wall.
210.52(A)(4) Countertop and Similar Work Surface Receptacle Outlets. Receptacles installed for countertop and similar work surfaces as specified in 210.52(C) shall not be considered as the receptacle outlets required by 210.52(A).

(2) Floor Receptacle Outlets. A meeting room with any floor dimension that is 3.7 m (12 ft) or greater in any direction and that has a floor area of at least 20 m2 (215 ft2) shall have at least one floor receptacle outlet, or at least one floor outlet to service receptacle(s), located at a distance not less than 1.8 m (6 ft) from any fixed wall for each 20 m2 (215 ft2) or major portion of floor space.

NEC Commentary: These requirements apply to meeting rooms in a variety of occupancies, including office buildings and hotels. For most rooms in commercial buildings, there are no NEC requirements for spacing of wall and countertop receptacles. However, 210.65 recognizes that there is a need to provide receptacles to facilitate meetings in which attendees will be using computers. This section, which utilizes the same receptacle requires used in swelling units as a basis for the spacing of meeting room receptacles, was revised for the 2020 edition to apply to non-rectangular meeting rooms, such as those that are round. Means of compliance include floor receptacle outlets and floor outlets supplying hard-wired furniture that contains receptacles. The 6-foot distance from fixed walls is to allow for emergency egress without occupants having to cross over flexible cords.

Common Code Official Interpretations - Confirm with local Authority Having Jurisdiction (AHJ):
- We can locate wall receptacles wherever we like in the meeting room; we just have to meet the quantity based on 12ft OC. For example, if there is a glass wall all the receptacles can be located the other 3 walls.
- A quadraplex receptacle counts as (2) wall or floor receptacles.



EXAMPLE:

PERIMETER:
16.5 + 14 + 20 + 14 + 0.5= 65 FT =
- At LEAST 6 WALL RECEPTACLES REQUIRED

AREA:
14 * 20 = 280 SQFT =
- AT LEAST 1 FLOOR RECEPTACLE REQUIRED

7. THE INSULATED GROUND CONDUCTOR MAY BE ROUTED IN A SEPARATE RACEWAY FROM THE CIRCUIT CONDUCTORS DIRECTLY TO THE PANELBOARD ISOLATED GROUND BUS BAR, OR WITH THE CIRCUIT CONDUCTORS IN THE SAME RACEWAY PER NEC 250.96(B), 250.146(D), AND 250.148. THE BASIS OF DESIGN SHOWN ON THE ONE LINE DIAGRAM, FEEDER SCHEDULE, AND GROUNDING RISER DIAGRAM INDICATES THE INSULATED GROUND CONDUCTOR ROUTING FROM THE ELECTRICAL ROOM GROUND BAR 'GB' TO THE TRANSFORMER, NOT TERMINATED WITHIN THE TRANSFORMER, THEN ROUTED WITH THE CIRCUIT CONDUCTORS IN THE SAME RACEWAY TO CONNECT TO THE PANELBOARD ISOLATED GROUND BUS BAR. HOWEVER, THE ENGINEER TAKES NO EXCEPTIONS BETWEEN EITHER OPTION AS LONG AS THE CONTRACTOR FOLLOWS THE NATIONAL ELECTRIC CODE.
8. FOR PANELS SERVING ISOLATED GROUND 'IG' CIRCUITS, PROVIDE A PANELBAORD ISOLATED GROUND BUS BAR TO TERMINATE ISOLATED GROUND CONDUCTORS FOR EACH CIRCUIT.
